

# Proportional and Graduated Symbols

Proportional symbol maps use symbols that vary in size to represent quantitative data. On this map proportional symbols display the population of each county based on the size of the circle symbolized. They are a great way to visualize the population and allow the reader to quickly compare the counties populations.

Graduated symbols are a way of displaying the data based on a set of defined classes. This map uses a Natural Breaks classification method to group the population data into classes. The circles represent each class of population data.
