

# Population by Age and Gender, 2016

Population pyramids are a way of visualizing the distribution of age groups in a region. These population pyramids were created using population data from the Canadian national census of 2016. Canadian national population as well as Nova Scotia provincial population is shown. Female population is shown on the left and male population on the right, both aggregated by age.

It can be seen that Nova Scotia's population contains less younger people per capita than Canada as a whole. The majority of Nova Scotia's population is middle-aged or older.
